

|                     |   |
|---------------------|---|
| Common name:        | MUKULUNGU   |
| Family:             | SAPOTACEAE  |
| Scientific name(s): | Autranella congolensis<br>Mimusops congolensis (synonymous) |

| LOG DESCRIPTION        |   | WOOD DESCRIPTION   |                         |
|------------------------|---|--------------------|-------------------------|
| Diameter:              | from 80 to 120 cm   | Colour:            | Red brown               |
| Thickness of sapwood:  | from 2 to 3 cm  | Sapwood:           | Clearly demarcated      |
| Floats:                | no  | Texture:           | Fine                    |
| Durability in forest : | Good  | Grain:             | Straight or interlocked |
|                        |   | Interlocked grain: | Slight                  |
| Note:                  | Heart of logs tends to split.<br>Wood red brown with darker brown veins. Grain sometimes oblique. |                    |                         |

| PHYSICAL PROPERTIES  |                        |                    | MECHANICAL PROPERTIES   |           |                    |
|--|------------------------|--------------------|---|-----------|--------------------|
| Physical and mechanical properties are based on mature heartwood specimens. These properties can vary greatly depending on origin and growth conditions. |                        |                    |   |           |                    |
|  | mean                   | standard deviation |   | mean      | standard deviation |
| Density *:   | 0.94 g/cm <sup>3</sup> | 0.03               |   |           |                    |
| Monnin hardness*:  | 7.7                    | 2.0                | Crushing strength *:  | 74 MPa    | 5                  |
| Coef of volumetric shrinkage:  | 0.66 %                 | 0.04               | Static bending strength *:                                    | 119 MPa   | 17                 |
| Total tangential shrinkage:  | 8.4 %                  | 0.3                | Modulus of elasticity *:                                      | 17060 MPa | 1660               |
| Total radial shrinkage:  | 7.4 %                  | 1.0                |   |           |                    |
| Fibre saturation point:  | 26 %                   |                    |   |           |                    |
| Stability:   | Poorly stable          |                    | (* : at 12 % moisture content ; 1 MPa = 1 N/mm <sup>2</sup> ) |           |                    |

#### NATURAL DURABILITY AND TREATABILITY

Fungi and termite resistance refers to end-uses under temperate climate.  
Except for special comments on sapwood, natural durability is based on mature heartwood.  
Sapwood must always be considered as non-durable against wood degrading agents.

|                  |  |   |
|------------------|--|---|
| Fungi:           | Class 1 - very durable   | * ensured by natural durability (according EN standards). |
| Dry wood borers: | Durable; sapwood demarcated (risk limited to sapwood)  |   |
| Termites:        | Class D - Durable  |   |
| Treatability:    | 3 - poorly permeable   |   |
| Use class*:      | 4 - in ground or fresh water contact   |   |
| Note:            | This species naturally covers the use class 5 (end-uses in marine environment or in brackish water) due to its high specific gravity and silica content.<br>According to the European standard NF EN 335, performance length might be modified by the intensity of end-use exposition. |   |

#### MAIN LOCAL NAMES

| Countries           | Local names |
|---------------------|-------------|
| Angola              | KUNGULU     |
| Cameroon            | ELANG       |
| Cameroon            | ELANZOK     |
| Central African Rep | BOUANGA     |
| Congo               | MFUA        |
| Dem Rep of Congo    | MUKULUNGU   |

---

---

## MUKULUNGU

---

### REQUIREMENT OF A PRESERVATIVE TREATMENT

---

|   |   |
|---|---|
| Against dry wood borer attacks:           | Does not require any preservative treatment |
| In case of temporary humidification risk: | Does not require any preservative treatment |
| In case of permanent humidification risk: | Does not require any preservative treatment |

---

### DRYING

#### Possible drying schedule

| Drying rate:           | Slow                     | Temperature (°C) |          |          | Air humidity (%) |
|------------------------|--------------------------|------------------|----------|----------|------------------|
|                        |                          | M.C. (%)         | dry-bulb | wet-bulb |                  |
| Risk of distortion:    | High risk                | Green            | 40       | 37       | 82               |
| Risk of casehardening: | No information available | 40               | 44       | 38       | 68               |
| Risk of checking:      | High risk                | 30               | 44       | 36       | 59               |
| Risk of collapse:      | No information available | 20               | 46       | 36       | 52               |
|                        |                          | 15               | 49       | 37       | 46               |

This schedule is given for information only and is applicable to thickness < 38 mm.

It must be used in compliance with the code of practice.

For thickness from 38 to 75 mm , the air relative humidity should be increased by 5 % at each step.

For thickness over 75 mm , a 10 % increase should be considered.

Note: Must be dried carefully.

---

### SAWING AND MACHINING

---

|                       |  |
|-----------------------|--|
| Blunting effect:      | High   |
| Sawteeth recommended: | Stellite-tipped  |
| Cutting tools:        | Tungsten carbide   |
| Peeling:              | Not recommended or without interest                        |
| Slicing:              | Good   |
| Note:                 | Requires power. Sawdust very irritant for throat and nose. |

---

### ASSEMBLING

---

|                     |                               |
|---------------------|-------------------------------|
| Nailing / Screwing: | Good but pre-boring necessary |
| Gluing:             | Correct (for interior only)   |

---

### END-USES

Main known end-uses; they must to be implemented according to the code of practice.

Important remark: some end-uses are mentionned for information (traditional, regional or ancient end-uses).

---

Hydraulic works (seawater)

Sleepers

Bridges (parts in contact with water or ground)

Posts

Industrial or heavy flooring

Heavy carpentry

Flooring

Vehicle or container flooring

Stairs (inside)

Bridges (parts not in contact with water or ground)

Interior panelling

Sliced veneer

Exterior panelling

Cooperage

Resistant to one or several acids
